

## RMHMDU1

The **RMHMDU1** discharge unit has been developed specifically to discharge the “**HAWK**” 24 volt Ni-MH battery.

This universal discharge unit will work on 110 volts through to 240 volts AC, allowing it to be used in any part of the world.

Designed to inform the operator as to the maximum level of charge capacity (Ah) remaining within the “**HAWK**” battery

This unit will inform the operator of both voltage and current draw whilst monitoring the time taken to discharge via its resettable timer.

The unit has an interlock failsafe system which automatically shuts the unit off if any electrical problems develop either with the battery or the unit itself.

Operation is totally automatic, just plug the battery in and once connected with the power switch in the ON position, the unit will automatically switch off when the task is completed.
